ACKNOWLEDGMENT

The acreage, production, and value statistics in this bulletin are official State and USDA estimates prepared by the Florida Agricultural Statistics Service. The county and area detail were made possible by the participation of the Department of Food and Resource Economics, University of Florida, in the estimating program. The Bureau of State Farmers' Markets, Florida Department of Agriculture, and the County Extension Agents, University of Florida, Cooperative Extension Service, were also very helpful in supplying area and county information. Shipment statistics were provided by the Market News sections of the Florida Department of Agriculture and the USDA Agricultural Marketing Service.

Grower organizations have provided valuable assistance and data throughout the season. These groups include the Florida Celery Committee, Florida Tomato Committee, Florida Sweet Corn Exchange, South Florida Vegetable Exchange, Zellwood Sweet Corn Exchange, and North Florida Growers Exchange. Sales agencies and transportation firms provided additional inputs needed to complete the statistical story.

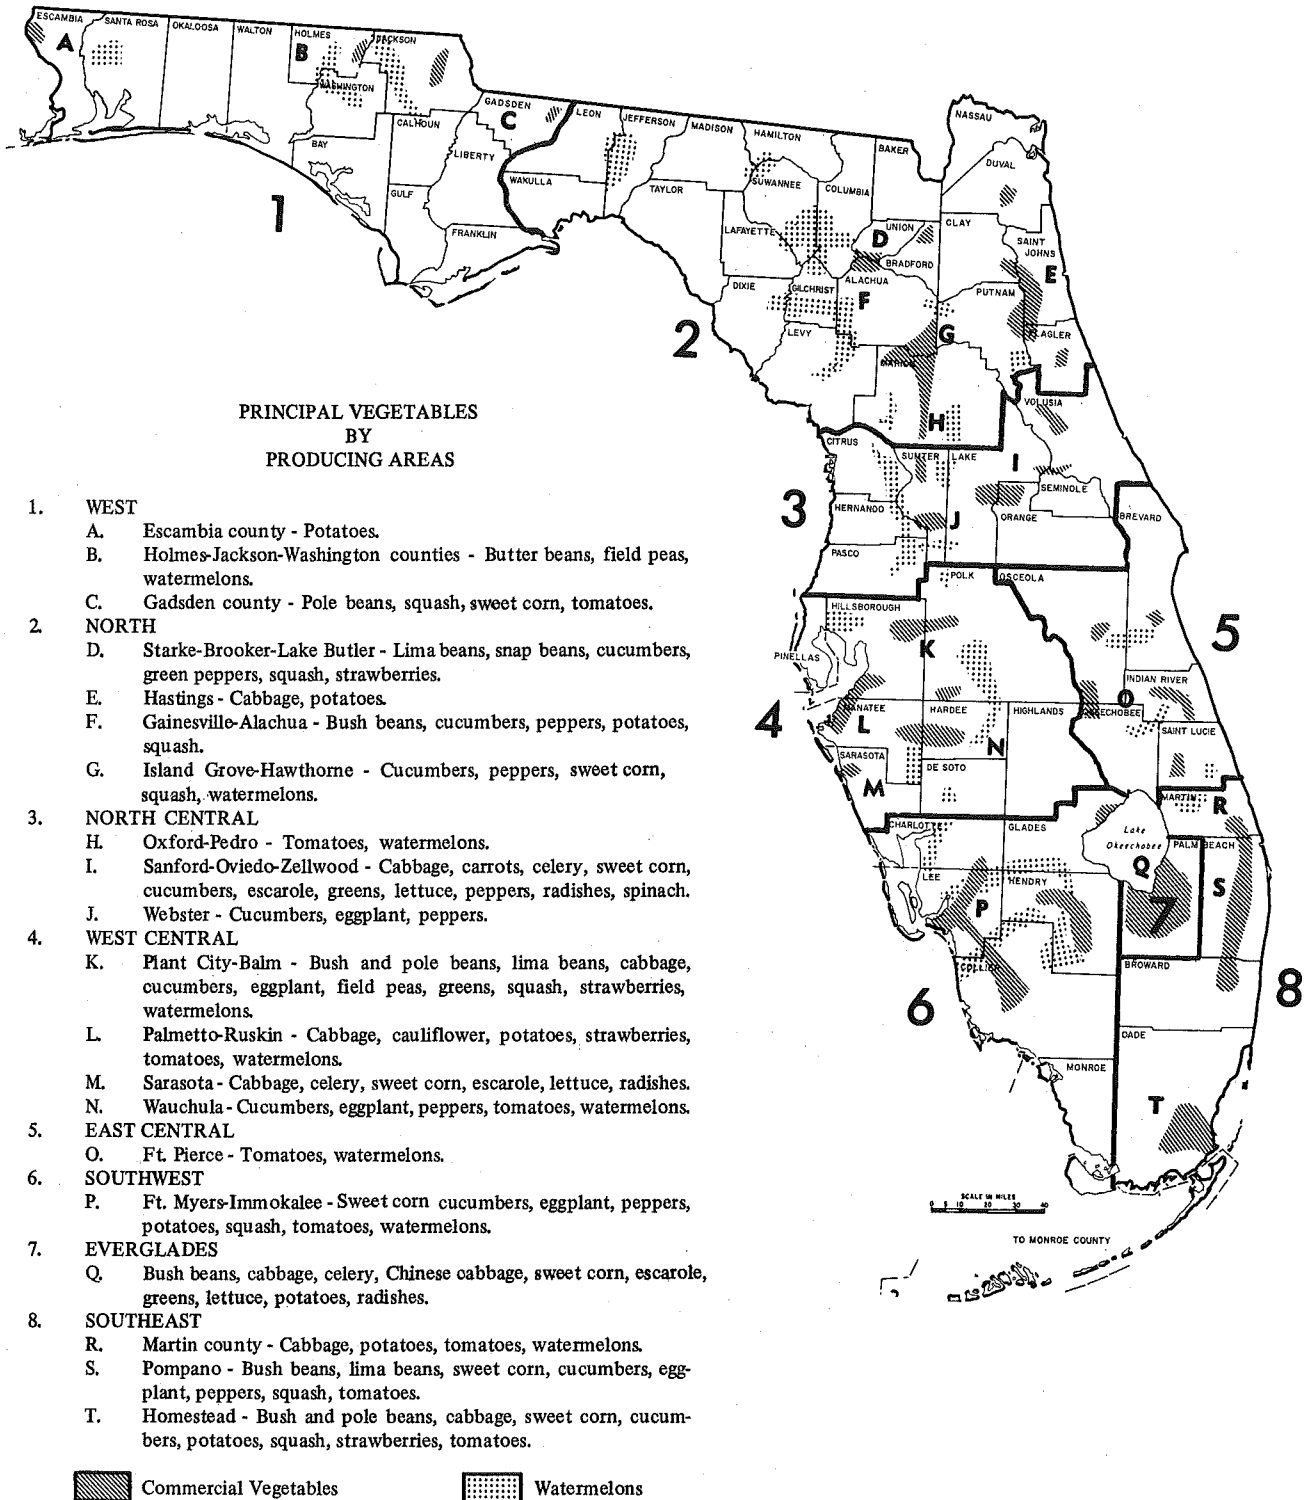

Foremost, the growers, shippers, and processors volunteered most of the basic data used in developing these statistics. The public spirited cooperation of these individuals and groups is appreciated.

Fieldmen Larry Amlong, Palmetto; E. J. Hutchins, Deerfield Beach; Charles Robertson, Homestead; and James Spires of Immokalee collected much of the basic acreage, production, and price statistics in this bulletin. This report was assembled under the direction of Wade Adams, Bill Erwin, and Shirley Zonner of the Florida Agricultural Statistics Service and Buck Buchanan, Market News Section. The authors also wish to thank Ray Crickenberger, Marcelo Diaz, Kitty Hildreth, Pat Quittance, Tommy Scherer, Pat Todd, and others of the Florida Agricultural Statistics Service who assisted in compiling and preparing this report.

Summary of Shipments by Crops, by Months, 1986-87	--	--	50	--

DEFINITIONS AND EXPLANATIONS

SEASONAL GROUPS--During the growing season, estimates were prepared for most crops on a six month seasonal group basis. The periods are for the crop year July-December and January through June. The two six month periods were combined in this publication into a crop year total for all crops. Production sold or utilized is shown by months.

PLANTED ACREAGE is the total acreage which has been planted for harvest during the crop year. Acreage lost and replanted to the same crop in time for harvest in the same quarter is counted only once. Acreage harvested and planted again to the same crop is counted twice.

HARVESTED ACREAGE is the acreage partially or completely harvested. Acreage lost before or at maturity through natural or economic causes is not included in the acreage for harvest.

YIELD is the average production per acre of merchantable quality harvested and sold or utilized.

PRODUCTION is the quantity actually harvested and sold or utilized.

UNIT VALUE for fresh market sales is the equivalent price received, f.o.b. shipping point basis and encompasses all grades and sizes marketed or utilized. Included are packing charges, selling charges, precooling, top ice, or other costs which contribute to the value of the product at shipping point. The value per unit for quantities sold to processors is the average value paid for usable quantities, on a "delivered to plant door" basis. This value includes transportation and other normal costs incident to delivery at plant door.

TOTAL VALUE is the equivalent value of production sold or utilized based on the unit value. Cullage and

other quantities not sold or utilized because of natural or economic factors are excluded.

OTHER COUNTIES include harvested acreage for all counties for which either published data would result in the disclosure of individual operations or acreage totals for specific commodities are of minor importance in the State.

All shipments and unloads, rail, truck, air, and boat, are recorded nationally in 10,000 pound units each day. Annual releases are in 1,000 cwt. In this publication, shipments and unloads for some commodities were converted to most common trading units. Rail and piggy-back weights and conversion factors were determined by several Market News Service field offices. Mixed car (rail) loadings by stations have been prorated by commodities.

Where possible, the national Market News Service in Washington, D. C. has established a single uniform weight per commodity to be used nationally in converting to weight units for the various means of transportation. Weights per common container used and number of units per rail car or truck may be obtained by writing the MNS office in Winter Park, Florida.

PRODUCTION AND PRICE UNIT--The official USDA vegetable crop estimates are published on a weight basis. For this bulletin, the official estimates for most vegetable crops have been converted to what is believed to be the most commonly used containers. If changes in container weights are necessary, all data pertaining to the production of the commodity in question are revised to maintain comparability between years. The table below gives the net weight used per container and the number of containers per hundredweight for Florida produce.

Most common unit, estimated net weight, and units per hundredweight, Florida produce, 1986-87 crop season

SUMMARY OF THE 1986-87 VEGETABLE SEASON

The farm value of Florida-grown vegetables, melons, potatoes, and strawberries sold in the 1986-87 crop year totaled \$1.4 billion, 17 percent more than the 1985-86 crop year. Crops increasing in value were snap beans, carrots, sweet corn, cucumbers, eggplant, green pepper, Irish potatoes, tomatoes, strawberries and watermelons. Crops with lower values than the previous year were cabbage, celery, escarole, lettuce, radishes and squash. All crops which showed declines in value, had lower season average prices and with the exception of cabbage and celery, had less production to sell.

There were some rather large changes in harvested acres from the previous year. Among those showing substantial increases, tomatoes and potatoes lead the list with increases of 5,100 and 3,100 acres respectively. Other crops with acreage increases include: sweet corn and radishes. Crops showing a substantial decrease in harvested acreage are snap beans - 3,920 acres; watermelons - 1,450 acres; cabbage - 1,100 acres and lettuce with a reduction of 1,000 acres. Other crops with acreage reductions included: carrots, cucumbers, eggplant, escarole, green peppers and squash.

Average yields for snap beans, cabbage, carrots, celery, sweet corn, cucumbers, eggplant, green peppers, and strawberries were higher than a year ago. Yields for lettuce, radishes, squash, tomatoes, watermelons and potatoes averaged below the previous season. Escarole yields were unchanged.

Season average prices for snap beans, sweet corn, cucumbers, eggplant, green peppers, potatoes, strawberries, tomatoes, and watermelons increased from the previous year. Season average prices for all other crops estimated were down from a year earlier.

Land preparation, planting and transplanting were active for fall vegetable crops by mid-July. Normal summer weather with hot days, warm nights and evening thunderstorms prevailed into September, and into October and into November. The first below normal weekly temperatures were not recorded until the first week in December. Planting schedules were generally maintained; however, for certain crops, the hotter than normal temperatures caused considerable plant loss. Replanting was quite active during this time period. Also, the winter hardy leaf crops did not do well in the continuing hot weather. By mid-October, most fields were being irrigated on a regular basis.

Temperatures during December, were first cooler than normal then, back to near record highs. There was no

freezing weather and with the exception of some patchy frost in the Panhandle, no frost. Cool weather prevailed during much of January. Frost the last week of the month burned some leaves in most production areas but, all in all vegetable crops escaped in good shape.

During February, temperatures remained cool with occasional frost and cool winds which inflicted only minimal damage. There were problems however, most notably in the Hastings area. Excessive rainfall during February, had rotted potato seed and flooded cabbage fields. The effect on the cabbage was immediate; on the potato crop, yield reductions were not fully realized until the potatoes were dug. Wet conditions in other production areas were causing disease problems which spray programs were hard pressed to control.

Heavy rains the last week of March, particularly in the west central area, caught the Plant City strawberry crop at it's peak. Harvest was slowed but, more importantly quality suffered. What appeared to be a record crop, fell short. Many fields were opened to U-Pic soon after. The southwest watermelon crop was also adversely affected by weather conditions during March. Both volume and quality of the early melon crop would be below earlier expectations.

A late season cold front the second week of April, brought record and near record low temperatures to all producing areas. Tender crops were burned in many fields. Young watermelon fields in the north and north central areas were hit especially hard. Many fields had to be replanted thus causing some marketing problems at harvest time.

Mid-April through May was mostly a time of warm days and mild nights. Rainfall was generally limited and irrigation was active. Harvest was underway on spring crops while declining seasonally on winter crops.

June weather was typically summer - hot days, mild nights and daily thunderstorms. Harvest was completed for most crops in the major production areas by the end of the month. Some watermelons along with small acreages of other crops were being harvested in the northern and Panhandle areas and the Gadsden County tomato crop was being harvested.

Most of the weather data for this summary were supplied through the National Weather Service, U.S. Department of Commerce, Ruskin, Florida. Information on the effects of weather on crops was provided by the Florida Agricultural Statistics Service fieldmen.

SNAP BEANS
1986-87

Bush beans are grown in most areas of the State. The southeast (Homestead and Pompano) continues to be the major producing area. Pole beans are grown primarily in the Homestead area with small acreages in Gadsden and Marion counties and the west central area.

Florida growers produced 4.3 million bushels of bush and pole beans during the 1986-87 season for fresh and processing utilization, up 7 percent from a year earlier. Acreage harvested for fresh and processing totaled 34,250 acres, down 10 percent from 1985-86, continuing a downward trend that started with the 1982-83 crop. Fresh market beans yielded a record average of 127 bushels per acre, surpassing the previous record established in 1976-77. Processing acreage averaged 100 bushel per acre, down 33 bushels from the previous year's crop.

The average f.o.b. price of \$11.46 for fresh market was \$1.23 per bushel higher than the previous year and the highest of record (previous high: 1982-83, \$10.60). Total value of the fresh market crop, at \$49.5 million, also established a new high. Processing beans averaged \$2.96 per bushel, 23 cents below a year earlier.

Planting got underway in early September in the west central, Homestead and Pompano areas. Warm weather prevailed through much of the fall season and crops responded with excellent progress. The first beans were picked around Pompano in mid-October, followed shortly thereafter by the other aforementioned areas. Strong winds during much of January and February lowered crop condition and ultimately yields. However, there was no damaging cold during this time. Rains during much of March and April created some disease problems in the Pompano and Homestead areas. The remainder of the season through June, was generally favorable.

Earliest fall supplies originate from west Florida. The northern and west central areas, the Everglades and the southeast also provide fall production. The southeast is the sole source of supply during the winter. The other areas resume production in the spring.

Production for 1986-87 extended from mid-October through early June. The fall crop peaked in December. Marketing then declined through February. Volume began to increase in March and peaked again in April. A good volume was available through May then declined to the end of the season, the last of June.

CABBAGE
1986-87

Florida's cabbage growers produced 5.7 million crates and bags of cabbage during the 1986-87 season, up 2 percent from the previous year but 26 percent below 2 years ago. The gross value was \$26.2 million, down slightly from the \$26.7 value of the previous year's crop. The average f.o.b. price was \$4.62 per crate or bag, down 19 cents from the \$4.81 received for the prior season's crop. The lower average price more than offset the slight increase in production thus, the reduction in value.

Total plantings were 16,600 acres, down 12 percent from the 18,850 acres planted during the 1985-86 season. Acreage harvested amounted to 13,300 acres. This was 17 percent less than last season. The average yield of 427 crates or bags per acre was up 41 bags from the previous season's average.

The Hastings area, which includes the three counties of Flagler, Putnam, and St. Johns, continued as the leading producing area in the State. This area accounted for 44 percent of the State's production during the 1986-87 season. The leading cabbage producing county is St. Johns with 3,500 acres harvested, or 26 percent of the State's total.

Transplanting got underway by mid-September. The most active period was October through December. Direct seeding in fields occurred between August and November. Only a small percentage of the total acreage planted is seeded direct in fields.

First cuttings began the end of October. Volume increased in each succeeding month through April. Harvest then tapered off to mid-June when the last cabbage was cut in Hastings. Fall production accounted for 11 percent of total production, up slightly from a year earlier; winter production accounted for 50 percent of the total production and spring production accounted for 45 percent.

With the exception of the spring Hastings crop, the weather was generally conducive for producing a good crop in all areas. Excessive rainfall during both planting and harvesting in the Hastings area reduced yields considerably and this 3-county area applied for disaster relief. In the meantime, the southern production area produced a record yield for the crop year.

CARROTS
1986-87

Florida growers produced 1,065,000 cwt of carrots for both the fresh and processing markets during the 1986-87 season, up 25 percent from the 849,000 cwt produced last season. Carrots for fresh use accounted for 87 percent of production while processing use was 13 percent. This compares with 79 percent for fresh use and 21 percent for processing during the 1985-86 season. About 17 percent of 1986-87 fresh market carrots were mini or finger carrots, compared with 18 percent for the previous season. The remaining 83 percent were regular type carrots.

Producers harvested 12,100 acres of carrots during 1986-87 from the 12,600 acres planted. Both planted and harvested acreage was down from the 13,000 acres planted and the 12,300 acres harvested in 1985-86. Growers received an average price of \$10.80 per cwt in 1986-87 compared with \$13.00 per cwt received in the previous season. The total value of carrots reached \$11.5 million,

up slightly from the \$11.0 million received during the previous season. The increase in value and production can be attributed to the 1,900 pounds per acre increase in average yield; from 6,900 pounds last season to 8,800 pounds per acre for the 1986-87 season.

Growers began fall crop seedings in August and followed weekly planting schedules with no major interruptions until mid-February. Harvest of mini or finger carrots started the end of October from the muck soils around Lake Apopka near Zellwood, and around Fellsmere. Mini carrot digging began around the first of November in the Everglades' muck soils south of Lake Okeechobee. Regular type harvest commenced at the end of November in Zellwood and Fellsmere. Digging was slowed from the end of March through mid-April by overabundant rainfall. Record low temperatures during mid-April delayed maturation of some carrots in the Zellwood area. Harvest was completed by the end of June in all areas.

CELERY
1986-87

Florida celery marketings of 6.03 million crates were up 2 percent from last year. These marketings were harvested from 8,500 acres, unchanged from a year earlier. The average yield of 709 crates per acre compares with 695 crates the previous year.

The Everglades, with 82 percent of the harvested acreage in the State, was the foremost area of production throughout the season. The north central area, supplemented by a light supply from the Sarasota and Fellsmere areas, accounted for the remaining 18 percent of acreage and provided continuous supplies during the season.

The total value of the crop--\$42.8 million--was 2 percent below a year ago and 10 percent below the most recent 5 year average.

The season average price, at \$7.09 f.o.b. per crate, was 27 cents lower than the previous year. Prices for the 1986-87 season compared with prices for the previous season, were higher for the first cuttings in November, fell in December below a year earlier; then averaged higher during January through March. They again fell below the previous year during April through June. The last cuttings in early July averaged \$9.06.

Plant bed preparation and seeding were in progress by mid-June in both major production areas. Transplanting was underway in August and became active by early September.

Plantings in the Everglades were completed by the end of the last week in March. Plantings in the North Central area continued until the end of April.

Light harvest began by early November in the Zellwood and Everglades areas. Growing conditions, as is normal, were hot and humid in the summer and early fall months. Cooler weather by November was beneficial for growth and development. There was no significant damage from occasional winter cold spells.

Production increased gradually from November through May, then declined rapidly to its conclusion the first week in July. May, as is usually the case, was the peak month.

Quality and size were mostly good throughout the season. Yields were the highest since the 1960-61 season when an average yield of 715 crates was realized. Approximately 7 percent of the crop was not harvested for various reasons. Growers passed some acreage in order to maintain good size and quality celery.

Celery is subject to a Federal marketing order administered by the Florida Celery Committee. Field supervisors provided the basic acreage and production data. In cooperation with the Celery Committee, these data are assembled into weekly, monthly, and annual reports and published in this Annual Summary.

CHINESE CABBAGE
1986-87

Chinese cabbage is grown primarily on the mucklands in the Zellwood and Everglades areas. The organic soils provide a very good medium for rapid growth. Harvest was underway by late October and had reached a good volume by early December. Supplies were generally steady through

May, then tapered off to the end of the season around mid-June. Quality was generally good throughout the growing season. Shipments for 1986-87 totaled 210,000 crates compared with 244,000 crates a year earlier (see page 52).

SWEET CORN
1986-87

Florida growers produced 8 percent more fresh market sweet corn in the 1986-87 season than in the 1985-86 season. Production during 1986-87 totaled 11.5 million crates compared with 10.6 million crates produced in 1985-86. Harvested acreage totaled 51,100 acres for the 1986-87 season compared with 50,200 acres harvested the previous season. Yields averaged 224 crates per acre, up 13 crates from the 211 crates averaged per acre during the previous season.

Florida continued as the Nation's leading grower of fresh market sweet corn and led the Nation in value with production worth \$71,358,000. The season average f.o.b. price of \$6.22 per crate was a record, and was 53 cents higher than the 1985-86 average of \$5.69 per crate. Sweet corn ranked fourth in value of vegetables produced in the State, exceeded only by tomatoes, potatoes, and green peppers.

Plantings were underway in July for the fall crop in the Zellwood and Everglades areas, while plantings got started on the East Coast in early October. Some U-Pic fields were planted during late September in Dade County. Early plantings were delayed by tropical rainstorms in the southeast at the end of October. Light harvest was underway in Zellwood at the end of September and peaked during early November. The main crop harvest began in early November in the Everglades, while commercial crop plantings started in Dade County. Heavy rains during mid-November washed fields in the Everglades and delayed seedings in the southeast. U-Pic harvest began in Dade

County during mid-November, while Zellwood pickings were near complete by the end of the month. A sluggish market delayed Everglades harvest near the end of November. A warmer than usual December increased growth in all areas with harvest underway in the southeast at the end of the month. Everglades growers picked into January, however, ear sizes were smaller than usual. Dade County producers started commercial harvest in late December.

Southeast growers began winter plantings over the holidays. Adverse weather and a poor market prevailed in early January with some Dade County fields blown over. Spring crop seedings were underway by the first of February in the Everglades. Southeastern growers finished seedings by mid-February. Zellwood producers began spring crop plantings during the first of March.

Southeastern growers began spring crop harvest at the end of March. Plantings were slowed in Zellwood during the end of March by wet fields, and development was slowed by cool weather during early April. Everglades spring crop harvest started in early April and was peaking by early May. Zellwood producers made some replants in early May due to earlier frost damage. Harvest in Dade County and southeast was completed by mid to late May. Harvest of a small irrigated acreage on the west coast started in mid-June while mud delayed picking in Zellwood at the end of June. Everglades growers finished harvest by the end of June and Zellwood producers ended harvest in early July. North and North Central producers made local sales at the end of June.

CUCUMBERS
1986-87

Florida's production of cucumbers for fresh market during the 1986-87 crop year totaled 5.2 million bushels, essentially unchanged from the year prior. The 17,200 acres planted for fresh market was down 700 acres from the previous year. Acres harvested for fresh market totaled 16,100, down 800 acres from a year earlier. Acreage harvested for fresh market yielded 325 bushels per acre, up 15 bushels from the previous season and the second highest of record, exceeded only by the 326 bushel average for the 1984-85 crop. Total fresh market production was valued at a record high \$49.0 million, a 36 percent increase from the previous year. This is explained by the record high \$9.37 per bushel.

Supplies in 1986-87 were generally available from October through June and into early July. Supplies, while limited from January through March, were available. Many of the recorded shipments moving out-of-State, during this time period, were from offshore and truck imports resold in mixed loads.

Monthly prices for the 1986-87 fall crop, with the exception of the very early cukes, were generally lower than prices for the 1986-87 season. Prices, however, for the small winter crop were generally well above a year earlier and carried on through the spring months when over half the year's crop was harvested.

Cucumber acreage is well distributed across the State. The southwest area, with 33 percent of the planted acreage during 1986-87, is the largest area. The west central area accounted for 27 percent of the planted acres in the State. The southeast, (the only area to show an increase in acreage) was third with 25 percent of the

planted acreage. The west and north central areas provided the remainder of the acreage.

Harvest of the fall crop commenced in the west central area by the end of September and was up to a good volume by mid-October. By mid-October, the north central and Pompano crops were coming in. Fall production peaked in November as the southwest also came into production. The west central crop "picked out" in early December and volume from the other areas, then in production, declined. Supplemental supplies during this time period, were provided by small acreage in the northern area.

Planting of the spring crop was active during early January through March. While there was no freeze, there was some rather cool weather with accompanying winds. Growth was slowed along with some moderate foliage burn at times. The southwest and Pompano areas continued to furnish a very limited supply of cukes throughout the winter months. Dade County growers supplied mostly the local market during these winter months.

Harvest of the spring crop was underway in the southwest and Pompano areas by the end of March. These areas provided most of the supply through late April when the west central area started picking. Peak harvest was during April and May. Frequent rains during the spring leached fertilizer and increased the incidence of disease. The Pompano and the southwest crops were completed by early June followed by the west central area the end of June. An extremely good market kept growers picking over fields that would have been abandoned under more normal market conditions. Harvest of the spring crop in the northern area ran through June.

EGGPLANT
1986-87

Plantings totaled 2,400 acres, down 100 acres from the 1985-86 season. Yields increased, averaging 689 bushels per acre compared with 675 bushels for the previous season. Production of eggplant at 1,585,000 bushels, was slightly below last year's production. Total sales rose to a record high \$9.6 million compared with \$9.1 million a year earlier. This increase was due to the higher yield per acre and more importantly the record high season average price. The season average price of \$6.08 per bushel is 35 cents higher than a year ago and 24 cents higher than the previous record \$5.84 established in 1983-84. Compared with a year earlier, monthly prices for the fall crop were lower while winter and spring crops were higher than a year earlier.

The fall season provided generally excellent weather, in all areas. Yields were above normal. The crop didn't fare nearly so well during the winter. Cold temperatures and strong winds continually lowered crop condition in the Pompano area. After a mid-April cold spell, the crop made a quick recovery responding well to the generally favorable weather for the remainder of the season ending in early July in the northern area.

The distribution of marketings was generally normal. Harvest began in late September, reached a peak in November and dropped during the winter. Harvest began to increase in April, reached a peak in May. Harvest virtually complete by July. The southeastern area around Pompano continued to account for just under half of the harvested acreage. The northern and central areas combined, contributed just over one-third of the acreage harvested with the remaining acreage in the southwest.

Production is generally continuous throughout the entire crop year in the southeast and southwest. The crops in the western, northern, and central areas are for fall and spring harvest only because, the possibility of freezing weather is too great during the winter months.

First sales were from cuttings in the western and northern areas in late September. Harvest followed the usual pattern and progressed southward in the fall, continued through the winter in the southern areas, and then moved back northward in the spring.

ESCAROLE-ENDIVE
1986-87

Production of escarole and endive during the 1986-87 season totaled 2.4 million crates, down 7 percent from a year earlier. This reflects a reduction in harvested acreage (from 5,500 to 5,100 acres) and a slightly lower yield (from 480 to 479 crates per acre).

Prices during the season averaged \$4.96 per crate, compared with the record \$5.42 of a year earlier. The total value of sales, at \$12.1 million, was 15 percent below the previous year. The Everglades, which had 71 percent of the harvested acreage in the 1986-87 season, began seeding in late August. Weekly planting schedules continued through March. Light harvest began in late October and supplies were continuous through May. The planting of a small fall crop in the muckland around Zellwood got underway in late August and provided supplemental supplies throughout the fall months. Most of Zellwood's acreage was grown during the spring and provided

good volume, especially in the late spring months. The small acreage grown around the Lake Placid and Sarasota mucklands furnished supplemental supplies during much of the season.

Sales started slowly in late October and increased to a good volume by November. Marketings reached peak levels in the December through April period. Sales were complete for the season by early June with the last cuttings coming from the Zellwood area.

Growing conditions were generally favorable during most of the season. Early yields were lowered somewhat by persistent warm weather. The winter was freeze free and frosts inflicted only minimal damage.

LETTUCE
1986-87

Acreage, production, and value statistics of lettuce in this bulletin combine the various types into a single estimate. The types in order of importance are iceberg, romaine, Boston, bibb, and leaf.

Florida lettuce growers produced 2.0 million cwt of iceberg and specialty types during the 1986-87 season--a 14 percent decrease from the previous year. The average yield of 150 cwt per acre compares with 163 cwt per acre for the previous season and is the lowest since the 1971-72 season. Growers harvested 13,400 acres compared with 14,400 acres for 1985-86. The season average f.o.b. price for all lettuce, of \$15.32 per cwt was \$3.81 below the \$19.13 per cwt received the previous year. Monthly prices with the exception of January and February cuttings, were below the prices of a year ago.

The Everglades muckland accounted for 86 percent of the planted acreage and was the source of a continuous supply of good quality lettuce which began in early November and ended in late May. Zellwood is the other major producing area. Sarasota and the Lake Placid mucklands contribute light supplies during much of the season.

PEPPERS
1986-87

Florida produced a record 11.4 million bushels of peppers during the 1986-87 season, an increase of 2 percent from the 1985-86 season, the previous highest production of record. The average yield of 618 bushels per acre was 5 percent above the 586 bushels per acre of last season. This increase in yield more than offset the reduction in harvested acreage. Harvested acreage at 18,500 acres, was 700 acres below the previous year and the lowest since the 1980-81 crop.

Total planted acreage decreased 1,000 acres from the previous season. An increase in acreage for the southwest was more than offset by a major decrease in the southeast as well as decreases in all other areas. The southwest with 38 percent of the acreage and 44 percent of the production, surpassed the southeast as the major pepper producing area. The southeast had 32 percent of the acreage and 34 percent of the production; the west central area, 13 and 12 percent; the north, 8 and 5 percent; and the north central area, 9 and 5 percent.

The season average f.o.b. price of \$12.00 per bushel was a record--the first time to go over \$10.00 for an entire season and \$5.17 above last year's price. Prices were higher than the previous year for all months. The total value of \$137.0 million, another record, was 78 percent above the previous year. Marketings were light in

Seeding was underway in early September. All areas were actively planting by early October. The Everglades had continuous plantings through March.

Specialty types are grown in all production areas while, virtually all of the iceberg type is grown in the Everglades. Very light harvest of specialty types was underway by the end of October and continued light until late November. The first iceberg was cut in mid-November, in the Everglades. Volume gained significantly in December with cutting active in most areas. The Everglades continued to provide the bulk of the volume during the winter period. Supplies of all lettuce peaked in March, and declined to the season's end, the last week of May. Moderate supplies are available from the Zellwood area during the fall and spring, but are rather light during the winter months.

Growing conditions from early fall through much of December were warmer than usual. This reduced both yield and quality. There were no freezes during the winter months however, a number of frosty mornings did inflict some damage along with slowing growth; the most notable being the mid-April frost which reduced supplies from the Zellwood area. A heavy volume was available from all areas during March and April. Quality, excepting the aforementioned problem, was generally good.

October but increased to a good level by December. Supplies declined during the January and February months but began an upward swing in March. The peak spring production occurred in May. The season then declined and was mostly over by the end of June.

Planting got underway in early August in all production areas. The abnormally warm weather took its toll on early plantings. Resetting was quite heavy in all areas resulting in uneven fields. Excessive bloom and fruit droppage was also a result of the warm weather as it continued into October. Harvest was underway in the Pompano area by mid-October and followed a couple of weeks later by the west central and southwest areas. Yields were generally below normal as a result of the weather problems. The fall season ended for the west central area the end of December.

Weather during the winter months caused no serious problems. There were no freezes and only minimal frost and wind damage during this time. The earlier bloom droppage lowered yields on first winter pickings. Early to mid-April cold snaps did slow plant growth and some bloom and fruit droppage, most notably in the west central area. For the remainder of the season, weather conditions were generally favorable. Yields for the winter and spring crops were improved from the fall crop.

POTATOES
1986-87

Potato production in Florida during 1987, including both winter and spring, totaled 6.3 million cwt, 26 percent less than the 1986 crop. A total of 36,500 acres were planted for harvest in 1987. Out of this total, 35,700 acres were harvested, about 10 percent more than in 1986. The value of the crop was placed at \$104.8 million, up 55 percent from the previous year. This increase is attributed to a \$8.70 increase in the average price received for the crop. The price received for all potatoes averaged \$16.60 per cwt compared with \$7.90 in 1986.

The average yield for all potatoes was 177 cwt per acre, 85 cwt below last year. In the Hastings area, which includes Flagler, Putnam, and St. Johns counties, the average yield was 170 cwt per acre, down 110 cwt from last year. Spring potatoes grown in other areas of the State had an average yield of 190 cwt per acre, the same as a year earlier. The winter crop averaged 200 cwt, down 10 cwt from the 1986 crop.

The "red-skinned" varieties are the dominant potatoes grown for winter harvest in south Florida. Most of the winter crop is sold for table stock but a few are sold to the potato chip industry. In the Hastings area, the "white-skinned" varieties dominate. Most of the Hastings production goes to the potato chip industry, although fresh market or table stock sales are increasing in importance.

The winter potato harvest was underway in late January and progressed through April. Winter harvest was very active in April. Harvest of the spring crop in the Hastings area got underway in late April with peak harvest in May. Digging continued into June and then declined sharply about mid-month. Wet soil conditions in the Hastings area resulted in poor stands and many fields were replanted. The heavy rain and cool temperatures in March in the Hastings area also resulted in poor yield.

SPINACH
1986-87

Spinach statistics have not been published separately for Florida in recent years to avoid disclosure of individual operations. However, data for these seasons have been included in the "Other Vegetable" series shown

in this publication. Data for 1973 and earlier are available upon request. Harvested acreage for 1987 decreased from a year earlier. Most of the crop is grown in the north central area.

SQUASH
1986-87

Florida's production of squash during the 1986-87 season, at 3.0 million bushels, was 6 percent below last year. The total of 15,200 acres harvested decreased 600 acres from the previous year. The average yield per acre, at 198 bushels, was 4 bushels short of the previous years record high yield.

The season average price of \$12.30 per bushel, was 30 cents below the record high season average price received for the 1985-86 crop. Monthly prices were lower than the previous year, for the fall crop and then with the exception of March, ran higher than the prior year. Total cash receipts amounted to \$37.0 million.

Florida produces acorn, butternut, yellow crookneck, yellow straightneck, white, and zucchini squash. Dade County, with nearly a third of the State's harvested acreage in 1986-87, produces yellow crookneck squash almost exclusively. The Pompano area, in addition to being a major producing area, is also an important market for squash grown in other areas of the State. This is especially true when local supplies reach low levels

during the winter months. The southwest area produces a continuous supply of most types. Central, north, and west Florida provide a good volume of most types during the fall and spring season.

Squash is one of the few crops grown in Florida that is shipped every month of the year, although shipments during the summer are light and mostly confined to local markets. The 1986-87 season got off to a good start. Marketings increased to a fall peak in November and early December, then declined seasonally during the winter months. While there were no freezes during the winter months, there were a considerable number of cold days with foliage burning winds and/or frost. This weather lowered yields especially in the Dade County and Pompano areas. Volume increased in late March and early April. A late season cold front the second week of April further reduced yields. Volume declined in May and into June as the major production areas ended their season. Prices during the spring season were extremely attractive for growers whose fields had escaped the season's adversities.

RADISHES
1986-87

Radishes planted by Florida growers totaled 29,700 acres during the 1986-87 crop year while harvested acreage amounted to 27,000 acres. This compares with 29,400 acres planted and 26,100 acres harvested during the 1985-86 season. Yield per acre averaged 207 cartons compared with 216 cartons during the previous season. Production at 5,589 thousand cartons was 1 percent below the 5,638 thousand cartons produced during the 1985-86 season. The crop was valued at \$17.6 million dollars, down \$3.7 million from the previous season's value. The average f.o.b. price was \$3.15 per carton, down 63 cents from the 1985-86 season.

Seedings for the 1986-87 crop were underway during early September in the Everglades and north central area. Light digging began in the north central area around the first of October with Everglades producers beginning harvest by mid-October. Some yields in the Everglades were reduced by fall rains with digging slowed in all areas by excess water standing in fields during early December. Harvest again slowed for the end-of-year holidays. Supplies were reduced in early February due to earlier January cold temperatures. Harvest was again delayed by wet, cold weather in central areas during mid-April. All digging was completed by late June.

STRAWBERRIES
1986-87

Florida strawberry growers produced a record high 9.2 million flats during the 1986-87 season, up 22 percent from the 1985-86 season. The record crop can be attributed to the record high yield of 1,876 flats per acre realized by growers. This record yield compares with 1,543 flats per acre averaged during the previous season. Acreage harvested, at 4,900 acres, was unchanged from a year earlier. Producers also received a record high season average f.o.b. price of \$7.30 per flat, up 66 cents from the 1985-86 season. As a result of the record high production and season average price a new high crop value of \$67.1 million was set. This was 34 percent higher than the \$50.2 million that growers received for the 1985-86 crop.

Growers in the west central and Dade County areas of Florida prepared ground and laid plastic during late September and early October. Transplanting started in the west central area in mid-October while Dade County growers began transplantings at the end of October. The record high temperatures that occurred during the fall hindered development of strawberries somewhat. Light

harvest got underway in the west central area during early December with harvest of the commercial crop starting at the end of February and fields opened to U-Pic harvest by mid-April. Dade County producers began U-Pic harvest after mid-December, while Bradford County growers started picking in late April. Heavy rains at the end of February and again in mid-April damaged fruit and caused significant losses to some producers in the west central area. A strong market during mid-May caused some west central area growers to return U-Pic fields to commercial harvest. Dade County producers ended harvest in early May while those in Bradford County and in the west central area stopped picking by early June.

Slightly over 45 percent of the 1986-87 strawberry crop was harvested during March, about the same as the previous season, but down somewhat from over 50 percent being harvested in the two preceding years. The seasonal decline began in April and continued until picking ceased in early June. Prices averaged lower in January and May than for the 1985-86 season, but were higher during all other months.

TOMATOES 1986-87

The value of the 1986-87 Florida tomato crop for fresh market and processing totaled a record high \$515,682,000, exceeding the previous record high value of \$457,823,000 attained during the 1985-86 season. The f.o.b. price received for fresh market tomatoes averaged a record high \$7.78 for a 25-pound carton, 16 cents above the previous high of \$7.62 per carton averaged during the 1985-86 season.

Total production of 67.1 million 25-pound carton equivalents, exceeded the 1985-86 season's production by 10 percent and set a new production record for Florida. The previous record production of 61.1 million cartons was set last season. Tomatoes utilized for fresh production accounted for 99 percent of total production with processing tomatoes making up the remaining 1 percent. The Palmetto-Ruskin area accounted for 39 percent of total production, while the southwest accounted for 33 percent. Dade County made up 14 percent and the Ft. Pierce-Pompano area produced 10 percent. The remaining 4 percent of the tomato crop was produced in the west, north, and north central areas of Florida.

Although fresh market yield at an average of 1,241 25-pound cartons, or 31,025 pounds, per acre fell below the 1,243 25-pound cartons per acre averaged during the previous season, acreage harvested at 53,300 acres was up 11 percent from the 48,200 acres harvested during 1985-86. Average monthly prices received for fresh market tomatoes held above \$6 for all months during 1986-87, and fell below 1985-86 monthly prices only in December, January, and April. Producers received the highest average monthly price of \$10.00 per carton in October, while the lowest monthly price of \$6.45 per carton was received in February.

Tomato planting got underway in all areas except Dade County in July. Dade growers began seedings in late August and early September, about 2 to 3 weeks earlier than usual. Hot, dry weather during early fall caused spot resetting, and bloom and fruit droppage. Frequent rains during late October and early November caused some

fruit check scars in the Palmetto-Ruskin and southwest areas, and delayed winter crop transplanting in the Ft. Pierce-Pompano area. Hot temperatures during late November and early December caused fruit to ripen earlier than usual in Dade County. Fall crop harvesting started during early to mid-October in the Palmetto-Ruskin area and Gadsden County, while most other areas began picking during late October. Dade County harvests got underway during late November and early December. Palmetto-Ruskin growers finished winter crop harvests in late December and early January. Dade County growers ended seedings by early January while spring crop plantings began in Palmetto-Ruskin around mid-January and in the southwest by early February. Ft. Pierce-Pompano and southwestern producers were done transplanting at the end of February.

Cold, wet, windy weather during January burned leaves and scarred fruit in the Ft. Pierce-Pompano and Palmetto-Ruskin areas. Near the end of February Ft. Pierce-Pompano picking continued steady. The late spring crop was damaged by winds in Dade County during early March. Palmetto-Ruskin growers ended most spring crop plantings by mid-March as southwestern producers began harvest.

Light frosts and heavy rains during early to mid-April damaged some early spring crop fields in the Palmetto-Ruskin area. Dade County harvests were virtually completed by the end of April, while Palmetto-Ruskin producers began picking the spring crop. Hail in the Palmetto-Ruskin area during early to mid-May caused some damage to fruit. Ft. Pierce-Pompano and southwestern growers completed picking by the end of May. Gadsden County producers started harvest by early June with rain near the end of June damaging some fruit.

Fall shipments peaked in December with 15.8 percent of the crop marketed during that month. During the winter season grower marketings peaked in January which accounted for 12.8 percent of all marketings. Spring crop marketings peaked in May with 24.0 percent of total production marketed.

WATERMELONS 1986-87

Watermelon acreage planted during the 1986-87 season totaled 54,900 acres--a 3 percent increase from the 1985-86 period. Of the total acres planted, 46,100 acres were harvested. This was 3 percent less than the previous season. The crop of 7.2 million cwt was 17 percent less than last season's production of 8.7 million cwt. The average yield for the State was 157 cwt per acre, down 15 percent from the previous year. The area yields varied from 100 cwt in the Panhandle to 187 cwt in the south.

The average price received was \$9.64 per cwt, up from last season's price of \$6.23 per cwt. Prices received by growers for melons were highest in the south and west central area where the harvest begins early. The total value of the crop was placed at \$69.7 million. This was 28 percent above last year, and 12 percent above the previous record high value set in the 1983-84 season.

There is a small acreage of fall grown watermelons in the south and scattered central areas. These melons are harvested in November and December, depending on

weather conditions. This acreage and production is included in the spring crop. Some light seeding of the spring crop was underway by mid-December in the southwest and became very active in early January. Planting started in the west central area in mid-February and the north by mid-March. The crop made good progress through February. Wet conditions in March that continued through April started a downward trend in crop condition. A freeze in the first part of April killed a large amount of the north acreage that was up at that time. There was extensive replanting of this acreage.

The harvest of the southwest crop started in late April. The quality, size, and yield was poor to fair. The west central crop harvest got underway the first week of June with mostly good size and quality. The north-north central harvest was underway by mid-June with quality and size mostly good. The west harvest was active by the end of June with good size and quality. The season was over by mid-July for Florida watermelons.

OTHER CROPS
1986-87

Cantaloups are grown in Florida primarily in the spring and summer in the southwest and north central areas. Much of the production is sold through roadside stands and local markets. The peak harvest period is normally May and June. Harvest begins in the southwest and progresses northward seasonally. Some cantaloups also are grown during the fall months in the southwest and west central areas. Acreage continues at a relatively low level. This crop is not part of the regular program for vegetables and melons. Researchers continue to work toward developing new varieties that will be better adapted to Florida's soils and climate. There appears to be some promise that acreage may expand in the future.

Cauliflower is grown in the Zellwood, Hillsborough-Manatee, and Everglades areas. Acreage decreased from a year earlier. Supplies are available from late November through early May. At the present time, statistics are not available for publication. Shipment information is recorded by the Market News Service. In the 1986-87 season, there were 55 thousand cwt (221 thousand 25-pound cartons) shipped out of the State compared with 81 thousand cwt shipped the previous season.

Tropical vegetable production during the 1986-87 season increased slightly from the previous year. By far the majority of the acreage is grown in Dade County. Commercial production began in the early 60's. Tropical vegetables is a colloquial expression applied to certain vegetables eaten primarily by those of Latin American and Caribbean origin. The most common name for each crop followed by the scientific name is listed below. Other common terms for various vegetables are shown in parentheses. The crops consist primarily of boniato-*Ipomea batata* (sweet potato); calabaza-*Cucurbita* (pumpkin); malanga-*Xanthosoma caracu* or *Colocasia esculenta* (dasheen, jautia); and cassava-*Manihot esculenta* (crantz, yucca, tapioca). The boniato, Calabaza, and Malanga constitute the bulk of the production. The Dade County Agricultural Extension Service reported 11,900 acres of tropical vegetables planted in the 1986 calendar year. Peak production of malanga occurs in February through April. Efforts are being made to provide more even supplies throughout the year. Available land continues to be a limiting factor for all agricultural production in Dade County. New varieties of calabaza are being brought in from Columbia, South America to select those that do

best in south Florida. Miami is an important point of consumption for the Florida production. Also, considerable amounts are consumed in the Tampa Bay area. The supplies shipped out of State are primarily for the New York City and Philadelphia areas.

Collard, turnip, mustard, and other greens are grown throughout the State and centered around large population areas and in the muck soils of the Everglades and Zellwood areas. A good volume was available from December through April with the final shipments made in early April. Shipments totaled 293 thousand cwt during the 1986-87 season, almost doubling that of a year earlier.

Okra is grown in many areas of the State during the warm season of the year. However, Dade County produces okra for local use as well as for shipments to other States. Peak production takes place in May and June with a good supply in October and November.

Green onions and leeks are produced in the north central area. Supplies are marketed primarily for local use at roadside stands and markets. There are several large producers who ship to other States. Supplies of dry onions are limited. Most of the dry onions are produced in southern and west central areas of the State.

Parsley is available in both the curly and plain types. The bulk of the commercial volume shipped to other States is produced in the Everglades and Zellwood areas. Light supplies sold for local use are available from Sarasota, Lake Placid, and other areas.

Southern peas are grown primarily in the northwest, west central, and Everglades areas of Florida. Dade County also produces a considerable amount of southern peas. Light supplies are available from September through December. Heavy movement occurs in May and June, especially in northwest Florida. A high percentage of the crop is utilized for processing. Good supplies are sold through local markets for fresh use. Market News Service shipment statistics for out-of-State markets show 34 thousand cwt for fresh market during the 1986-87 season.

Watercress is available the year around. The major source of supply is the Oviedo area. Most of the production is shipped to northern and eastern markets in the United States. A limited supply is available from local State farmers markets, especially the Sanford market.

Vegetables, melons, potatoes, and strawberries: Acreage, yield, production and value,
